Why nobody answers the phone?

## MariCare – the leading provider of professional care solutions

Since its introduction to the market in 2005, MariCare Solution with Elsi® Smart floor, has been the unchallenged forerunner in its field. Thanks to its excellent performance and unique features that help improve service and quality, the system has been chosen by many new elderly care homes in Finland and elsewhere.

°Lsa™ Activity Sensing is our newest solution, specially developed for Home Care and existing Elderly Care facilities. Our customers want to offer their inhabitants the possibility to live at home longer, and we at MariCare will support and assist our customers to accomplish this goal.

No need to worry  
°Lsa will look after your loved one

## °Lsa™ Activity Sensing System

The °Lsa™ Activity Sensing System improves home care quality and resident's safety by sensing changes in long-term or short-term activity. If daily routines change suddenly or activity decreases gradually, it can be noticed from the activity indicators or an alarm can be sent to caregivers or relatives. The activity information can be analyzed and used to understand each individual resident's wellbeing and for example possible dementia progression.

The system senses different types of activities including general movement, sleeping, eating, going outside, and bathroom visits. An additional important feature of °Lsa™ is the fall alarm: °Lsa™ detects if the person falls down. °Lsa™ increases the feeling of security also by working as a burglar alarm.

All °Lsa™ products are based on wireless EnOcean technology. The °Lsa™ Gateway collects the data from different °Lsa™ sensors and sends it to the °Lsa™ Cloud Server using a wired or mobile (3G/4G) internet connection. °Lsa™ UI (User Interface) allows an online access to resident's data on the °Lsa™ Cloud server and by a quick look you can observe resident's up-to-date 7-day graph and long-term activity indicators. Alarms can be sent out from °Lsa™ Cloud Server either to Smart phones, or to DECT phones, or to the customer's central SOS Center.

“  
Thanks to °Lsa, I'm less concerned  
about mom, even though I live far  
away from her.”

“  
°Lsa Activity Sensing makes me  
feel safe and secure. I know help  
is there when needed.”

- Living room or hall

Kitchen

Opening the refrigerator
- Bedroom

Outdoors

Bathroom visit
- Alarm

Passivity

Motion detection

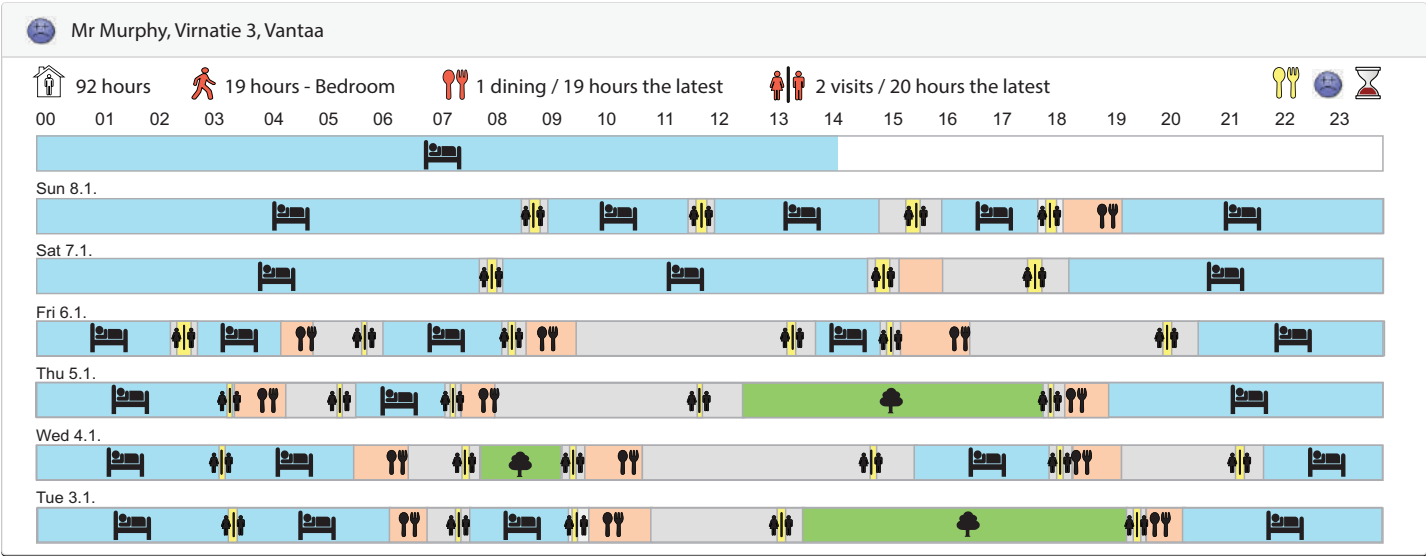

Burglar alarm
- Fall

Door

Low battery
- Activity

Time alarm

Fire

The sample short-term 7-day graph shows that the resident has been in the bedroom for an extended period of time. The resident last visited the kitchen 19 hours ago and has made only two visits to the bathroom. The alarm is triggered when activity indicator's limits are exceeded. Alarms can be also triggered based on events like "missed dining", "passivity (no movements in the morning)" or "bedroom time exceeded" (icons on the upper right corner of the graph).

The long-term 6-month graph shows normal activity levels. The resident's daytime activities are within the preset parameters in all areas.

The second 6-month activity graph shows that the resident's condition has deteriorated in a way that would otherwise go unnoticed.

Fall alarm - How it works

eLsa is activated when the person enters the room and is detected by the upper motion detector.

eLsa is not activated when a small animal such as a dog enters the room, since the upper motion detector will not be triggered in this case.

If the person falls, only the lower motion detector detects movement, and eLsa sends an alarm to the preset Smart Phone.

The fallen person receives quick help.

eLsa also works as a burglar detector

## eLsa™ Accessories

### eLsa Bed Sensor (optional)

eLsa Bed Sensor consists of a bed sensor and bed sensor module. The bed sensor module communicates wirelessly with the eLsa gateway. The bed sensor is placed between the mattress and mattress pad. The bed sensor can be used also for chairs and sofas.

eLsa Bed Sensor provides important additional features to the eLsa system. eLsa Bed Sensor can detect the presence of inhabitant, the sensor can also identify increasing moisture level by incontinence or excessive sweating during fever. Also optional nurse call button can be placed next to the bed witch can be connected to the bed sensor module.

Patented / Patent Pending

## Easy to install

The eLsa system is easy to install and doesn't require special tools. Instructions are included in the box.

## eLsa features

- Activity sensing:
  - general movement
  - time spent in bed
  - time spent outside
  - bathroom visits
  - eating times
- Automatic fall detection
- Motion detector
- Call for help
- Leaving the residence
- Staying outside
- Inactivity

## Additional features

- Smoke alarm
- Burglar alarm

All eLsa™ Activity Sensing products are easy to install and use. MariCare or its partner can organise introductory training for customers at care homes and private homes and assist with installation.

**MariCare™**

Member of MariElectronics Group

MariCare Oy is the forerunner company, for its unique smart floor, activity sensing and fall detection products. MariCare also provides a number of other security products for senior homes and elderly care facilities to improved service and the quality of life. For over 10 years MariCare has created remarkable innovations, enabling thousands of elderly people to live in a safe, homelike environment with the safety products around them.
